

## What to Do After an Adverse Event: An Overview and Suggested Algorithm

Angelica Mancone, MD, Tessa Mandler, MD, Amy Lee, MD, Norah Janosy, MD  
 Children’s Hospital Colorado, University of Colorado School of Medicine, Aurora, CO

- Adverse events can have medical, legal, and emotional implications for patients, families, and medical professionals. A protocol can facilitate appropriate actions even in a chaotic environment. Institution-specific guidelines should be followed.
- Along with patient care implications (first victim), second victim syndrome is the distress healthcare professionals experience after caring for a patient who suffered an adverse event.
- Supporting the care team involved will help to prevent a third victim (the next patient cared for, or the healthcare organization as a whole). Additional medical errors may occur as a result of the trauma experienced by the second victims.

### Adverse Event Algorithm

Immediately after event	<ol style="list-style-type: none"> <li>1. Mobilize a multidisciplinary support team (<a href="#">How to Approach Medical Errors</a>)</li> <li>2. Continue to provide patient care to its conclusion, if able.</li> <li>3. Delegate an Incident Supervisor to assign tasks and speak with perioperative teams and family.</li> <li>4. Close the involved operating room to investigate potential equipment or medical error. Do not discard, clean, disassemble, or alter anything (medical equipment). If applicable, allow family viewing of deceased.</li> <li>5. Debrief event with perioperative team.</li> <li>6. Contact hospital administrator and risk management.</li> <li>7. Disclose event to patient/families and provide support (<a href="#">How to Break Bad News to Families</a>). Plan discussion with the family, select a suitable space, involve support teams (interpreters, clergy, etc.), explain events, verify understanding, consider apology, and offer follow-up with families. Full disclosure and apology is beyond the scope of this one-pager due to administrative, risk management, and potential state-dependent medical-legal implications.</li> <li>8. Document events objectively for medical record and incident report. Consider personal notes for future reference.</li> </ol>
Within days-weeks after event	<ol style="list-style-type: none"> <li>1. Designate a Follow-up Supervisor (may be Incident Supervisor). Consider follow-up debrief with support services. Continue communication and investigation, and report to authorities if needed.</li> <li>2. Review formal reports submitted to authorities for accuracy.</li> <li>3. Communicate with hospital staff involved and consider process improvement interventions. Consider third party presentation at quality improvement and/or morbidity and mortality conferences.</li> </ol>

### Caring for Colleagues (see also [How to Set Up a Peer Support Program & Be a Good Peer-Supporter](#))

- Involve formally trained peer supporters, if available.
- Allow ample time, provide uninterrupted attention.
- Listen without judgement, avoid asking for specifics.
- Offer reassurance and validate colleague’s feelings and experience.
- Avoid shifting the focus to your own experiences.

### Expressions to Avoid When Talking to Colleagues After an Unexpected Adverse Patient Event

- |  |  |
|--|--|
| • It’ll be fine                              | • It could have been so much worse                             |
| • This will pass and you’ll get through this | • Things happen for a reason                                   |
| • Time heals wounds                          | • This is a good learning experience                           |
| • At least _____ didn’t happen               | • You’re given what you can handle                             |
| • This happened to me before...              | • The patient was old/sick                                     |
| • At least you won’t get fired               | • Things like this are bound to happen to us all at some point |
